

DATE OF STUDY: 23-MAY-2018

PATIENT NAME: SAT PREET 14/F

NCCT SCAN HEAD

Posterior fossa: -Both cerebellar hemispheres and rest. of brainstem show normal attenuation. 4th ventricle is normal.

Supratentorium: -There is evidence of a well-defined lobulated hyperdense extra-axial lesion measuring 3.8cm x 3.1cm in right anterior temporal region causing buckling of cortex. No associated white matter edema is seen.

Rest of both cerebral hemispheres show normal attenuation.

Basal cisterns, sylvian fissures and cortical sulci are normal.

Supratentorial ventricular system is normal.

No midline shift is seen.

No focal bony lesion is seen.

IMPRESSION: -Well-defined lobulated hyperdense extra-axial lesion in right anterior temporal region as described

D/D include: -?Meningioma

-??Aneurysm

SUGGESTED: CEMR for further evaluation

-May please be correlated clinically.

DR. ARCHANA GUPTA
